

Abstract of the Disclosur

A resealable container is provided having a container opening and a rim and a multilayer film covering the container opening and the rim. The multilayer film contains at least an outer layer, a sealing layer facing the rim and a layer of adhesive between the outer layer and the sealing layer. The sealing layer is secured around the rim and contains a weak spot such that when the resealable container is first opened a double bead of said sealing layer remains on the rim in the region of the weak spot. Such resealable containers have improved tear-open behavior and resealability.
